

**RNA-binding Protein Binding Specificity to Transported mRNAs in *Candida albicans***  
**Emma Landes, Class of 2019**

The fungal opportunistic pathogen *Candida albicans* can cause a wide range of disease in humans (1). *C. albicans*' ability to cause disease is related to its capacity to switch its structure between a budding yeast form and an elongated hyphal form (2). Therefore, it is essential that we understand the mechanisms responsible for this structural shift. There are specifi

## References
